

SCALING FROM LOGISTICS DELIVERY TO DELIVERY & COLLECTION OPERATIONS

PREPARED FOR: MBONGENI

PRODUCT: **COURIER LOOP**

CURRENT WEBSITE: [LOGISTICS.OLYXEE.COM](https://logistics.olyxee.com)

1. PURPOSE OF THIS DOCUMENT

The purpose of this document is to explain the next growth phase for Courier Loop.

Courier Loop already serves logistics companies by helping them manage customer delivery updates and operational communication. The next step is to scale the same core system beyond logistics, so that other businesses can also use Courier Loop to manage delivery, collection, and customer status updates.

This is not a change away from logistics. Logistics remains an important use case. The goal is to expand Courier Loop into a broader platform that supports any business that needs to keep customers updated about an item, order, or service.

2. EXPANSION DIRECTION

Courier Loop is scaling from a logistics-focused delivery tool into a broader delivery and collection communication platform.

The core problem remains the same:

Businesses need a reliable way to tell customers when something is ready, out for delivery, delayed, available for collection, collected, delivered, or completed.

Logistics companies already face this problem. But the same problem also exists in dry cleaning, food stores, retail, repairs, pharmacies, printing shops, and many other service-based businesses.

3. NEW PRODUCT POSITIONING

Courier Loop should be positioned as:

A delivery and collection communication platform for businesses that need to keep customers updated.

Expanded version:

Courier Loop helps businesses notify customers when an order, item, or service is ready, out for delivery, delayed, available for collection, collected, delivered, or completed.

This allows Courier Loop to remain relevant for logistics companies while also becoming useful to a wider range of businesses.

4. BUSINESS TYPES COURIER LOOP SHOULD SUPPORT

Courier Loop should support both delivery and collection workflows across different business types.

Examples include:

LOGISTICS COMPANIES

Notify customers when parcels are received, dispatched, out for delivery, delayed, or delivered.

Example:

“Your order is out for delivery and will arrive today.”

DRY CLEANERS

Notify customers when clothes are ready for collection.

Example:

“Your jacket is ready for collection.”

FOOD STORES AND RESTAURANTS

Notify customers when food is being prepared, ready for collection, or out for delivery.

Example:

“Your order is ready for collection.”

RETAIL STORES

Notify customers when online or in-store orders are ready for pickup or delivery.

Example:

“Your order is ready for pickup.”

REPAIR SHOPS

Notify customers when repaired items are ready.

Example:

“Your laptop repair is complete and ready for collection.”

PHARMACIES

Notify customers when medication or an order is ready for collection or delivery.

Example:

“Your order is ready for collection.”

PRINTING SHOPS

Notify customers when printed documents or products are ready.

Example:

“Your documents are ready for collection.”

5. WEBSITE DIRECTION

The current website should evolve from speaking only to logistics companies into speaking to all businesses that manage deliveries, collections, and customer updates.

The website should still include logistics, but logistics should become one major use case inside the broader Courier Loop platform.

The messaging should move from:

Logistics delivery management

To:

Delivery and collection updates for businesses

Or:

Customer status updates for deliveries, collections, and orders

6. UI DIRECTION

The UI should adapt based on the selected business type.

The user should first select the kind of business they operate. Based on that selection, Courier Loop should show the most relevant workflow, labels, statuses, and dashboard fields.

LOGISTICS COMPANY UI

Focus on:

- Parcel/order reference
- Customer details
- Driver or courier assignment
- Dispatch status
- Out for delivery

- Delivery attempt
- Delivered
- Failed delivery

DRY CLEANER UI

Focus on:

- Customer details
- Item type
- Service type
- Cleaning status
- Ready for collection
- Collection reminder
- Collected

FOOD STORE OR RESTAURANT UI

Focus on:

- Customer details
- Order number
- Preparing
- Ready for pickup
- Out for delivery
- Delivered
- Collected

REPAIR SHOP UI

Focus on:

- Customer details
- Item being repaired
- Repair status

- Ready for collection
- Collection reminder
- Completed

The interface can differ by business type, but the core system remains the same.

9. SHARED STATUS ENGINE

Courier Loop should use a shared status engine that works across industries.

Suggested universal statuses:

- Received
- In progress
- Ready
- Ready for collection
- Out for delivery
- Delayed
- Customer notified
- Collected
- Delivered
- Completed
- Cancelled

Each business type can rename, hide, or reorder statuses based on its workflow.

For example:

- A dry cleaner may use “Ready for collection” instead of “Out for delivery.”
- A logistics company may use “Out for delivery” instead of “Ready for collection.”
- A restaurant may use both “Ready for pickup” and “Out for delivery.”

10. PRODUCT MODULES

Courier Loop should be structured around reusable modules.

BUSINESS TYPE SELECTION

The business selects its industry or chooses a custom setup.

WORKFLOW TEMPLATES

Courier Loop provides default workflows based on business type.

STATUS MANAGEMENT

The business updates the status of each item, order, delivery, or collection.

CUSTOMER NOTIFICATIONS

Customers receive updates when a status changes.

CUSTOMER TRACKING PAGE

Customers can check the status without calling or messaging the business.

REMINDERS

The system can remind customers to collect items or confirm delivery availability.

AUDIT TRAIL

Courier Loop records when updates were sent, what status was sent, and whether the customer was notified.

11. WHAT MBONGENI SHOULD DO

Mbongeni should update the current Courier Loop website and product direction to reflect this expansion.

Tasks:

1. Keep logistics as a core use case.
2. Expand the website messaging beyond logistics companies.
3. Add delivery and collection language across the site.
4. Add business type selection to the product flow.
5. Add use cases for dry cleaners, food stores, retail stores, repair shops, pharmacies, and printing shops.
6. Update the homepage hero section to communicate the broader platform.
7. Make the UI adaptable based on business type.
8. Reframe Courier Loop as a customer status communication platform.
9. Avoid making the product look like it is abandoning logistics.
10. Present the expansion as the next growth phase of Courier Loop.

12. FINAL PRODUCT DESCRIPTION

Courier Loop is a delivery and collection communication platform that helps businesses keep customers updated when orders, items, or services are ready, out for delivery, available for collection, delayed, collected, delivered, or completed.

It started by solving delivery communication for logistics companies and is now scaling to support more businesses that manage customer updates, collections, and delivery workflows.
